

# «Keeping patients out of hospital» Capturing care trajectories

# Keeping patients out of hospital

- Every hospitalization is a failure to prevent or treat the patients condition in the community.
- Hospitalization rates vary dramatically across municipalities
- New health delivery models (chronic care model) -> patient centered delivery of evidence based care.
- The electronic medical record: Underused source of information

	hosp.days/1000 inhab/year, avg. 2002-2006			Deathrate/1000 inhab/year avg. 2002-2006	
	Raw	Adjusted (1)		Adjusted (2)	
Nord-reisa	1897	2214	Ref	92	
Nord-Norge	3311	4028	p < 0.0001	88	p=0.755 6
Sør-Norge	3033	3500	p < 0.0001	82	p=0.343 8

- 1) Adjusted for age, gender, distance to hospital, mortality, education, low-income groups, home municipality state.
- 2) Adjusted for age, gender, distance to hospital, education, low-income groups, home municipality state.

# Research questions

## Methodological – Part A:

- Can we extract information from the EHR which allows a meaningful characterisation and realistic modelling of patient pathways?
- Can patient pathways information predict salient outcomes ?

## Health care research – Part B:

- Are patient pathways which adhere to Chronic Care model principles associated with higher quality of care/ lower hospitalization rates?

# Objective:

## Trajectories of care vs. outcome

### Tech & method development

- IE from EHR → Events
- Events  $\rightleftharpoons$  Trajectories
- Trajectory analysis
- Abstraction, clustering and visualization
- Simple variables

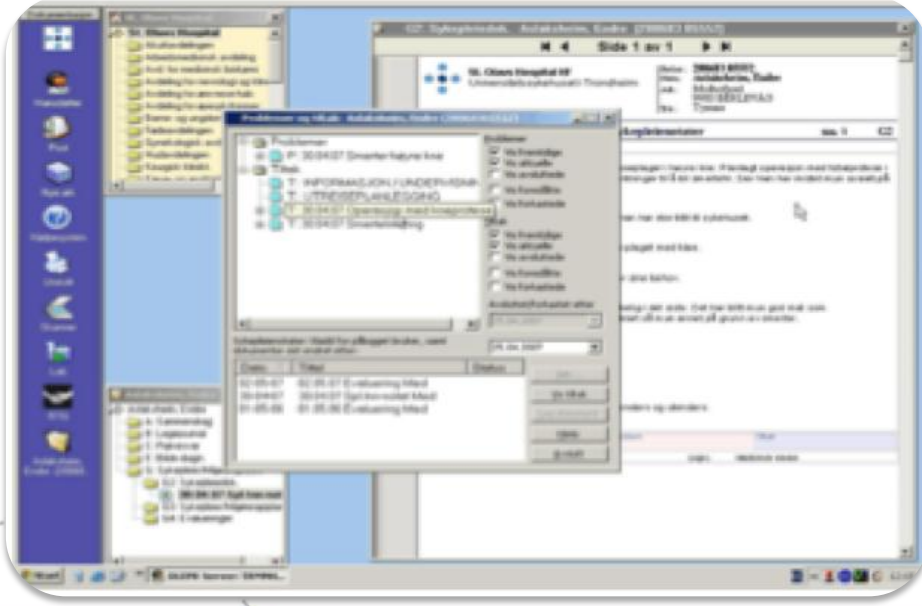

### Do trajectories matter?

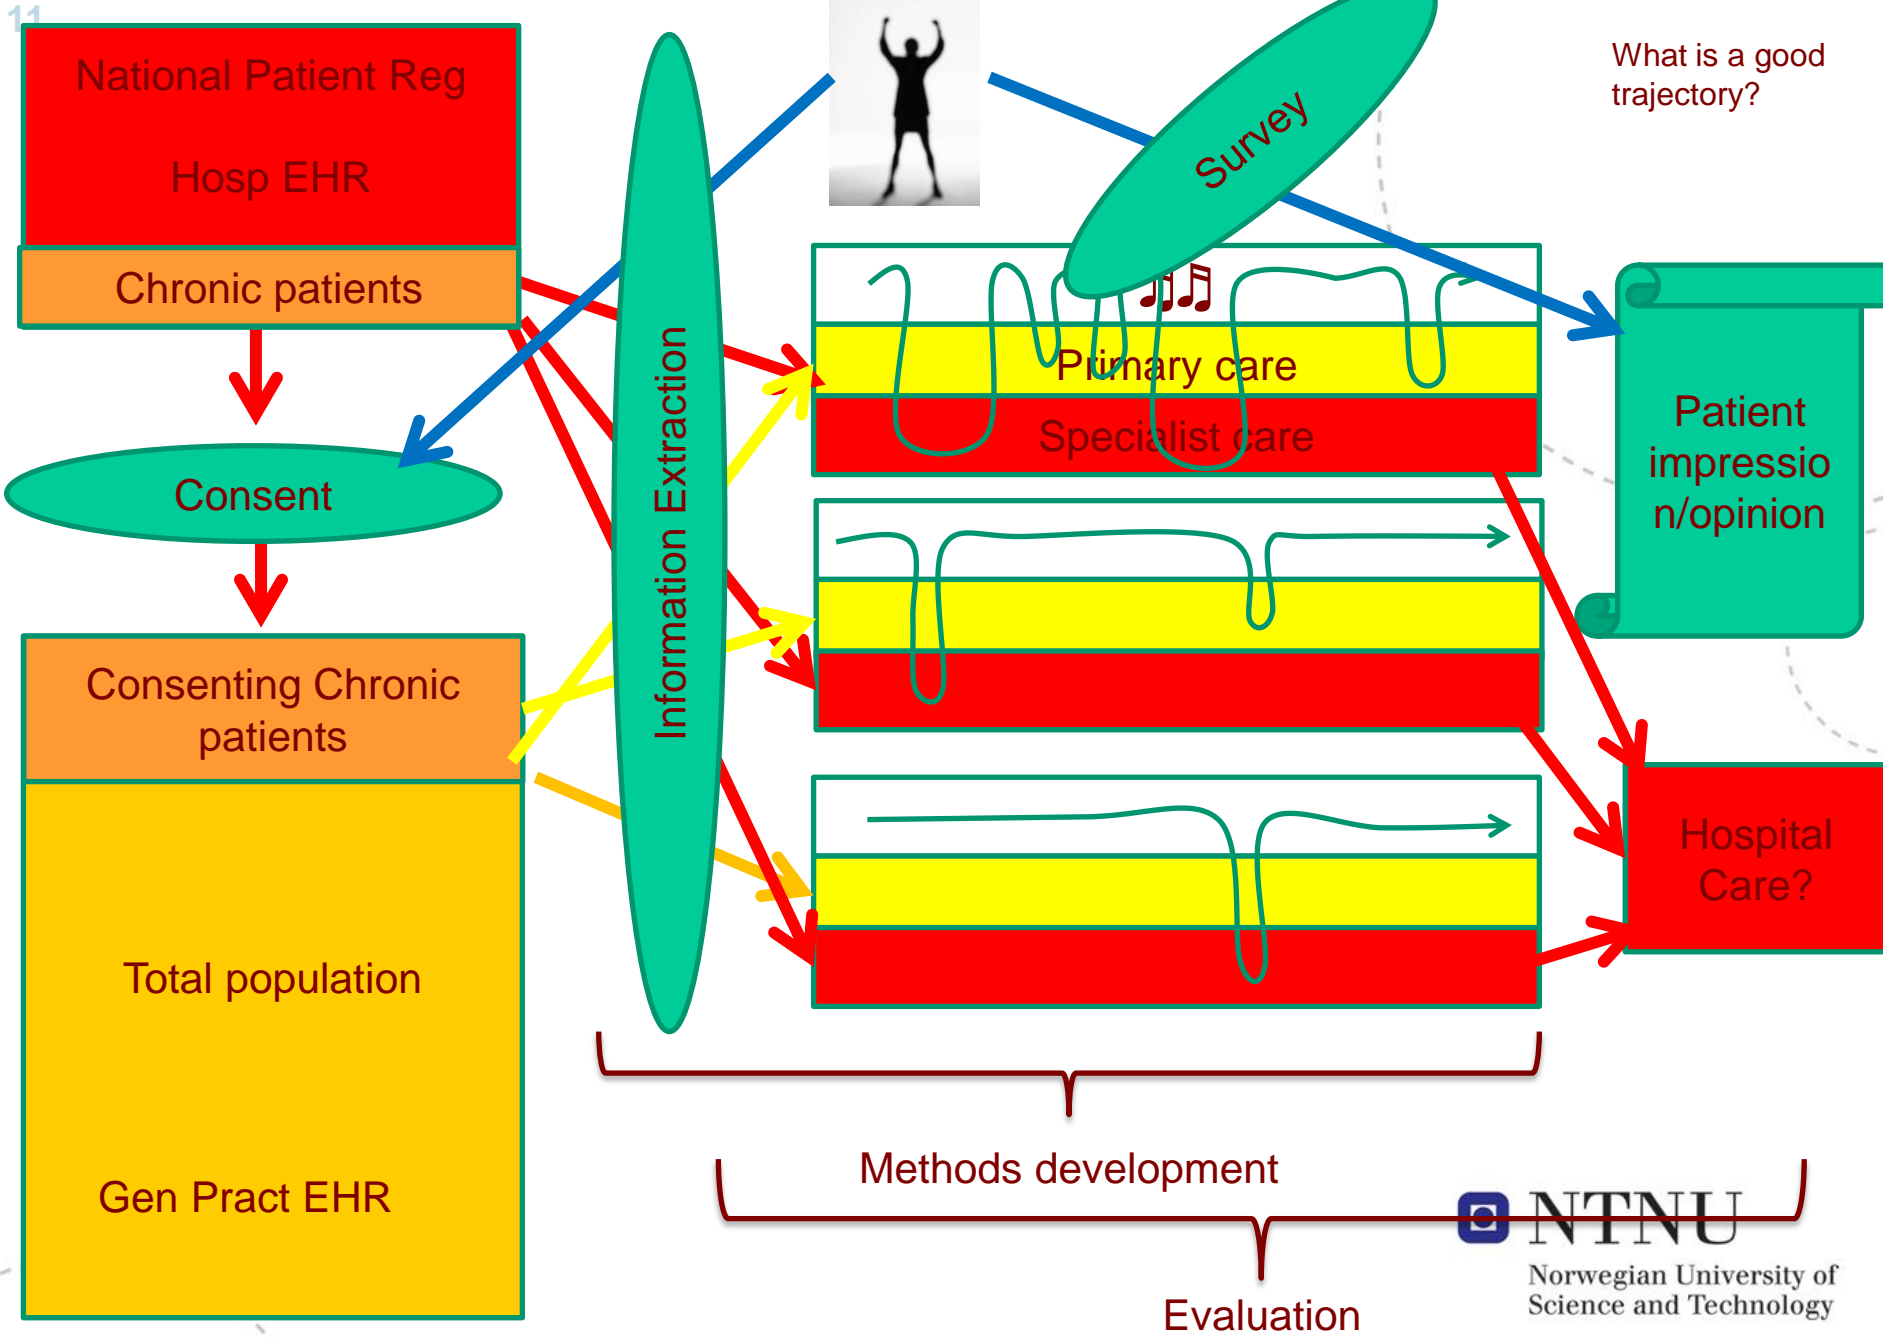

- Comparative effectiveness research
- Collaborative care

Are we interested in reality, or the  
documentation of it?

Is there a difference?

Can we make a mapping?

What is a good trajectory?

Survey

Information Extraction

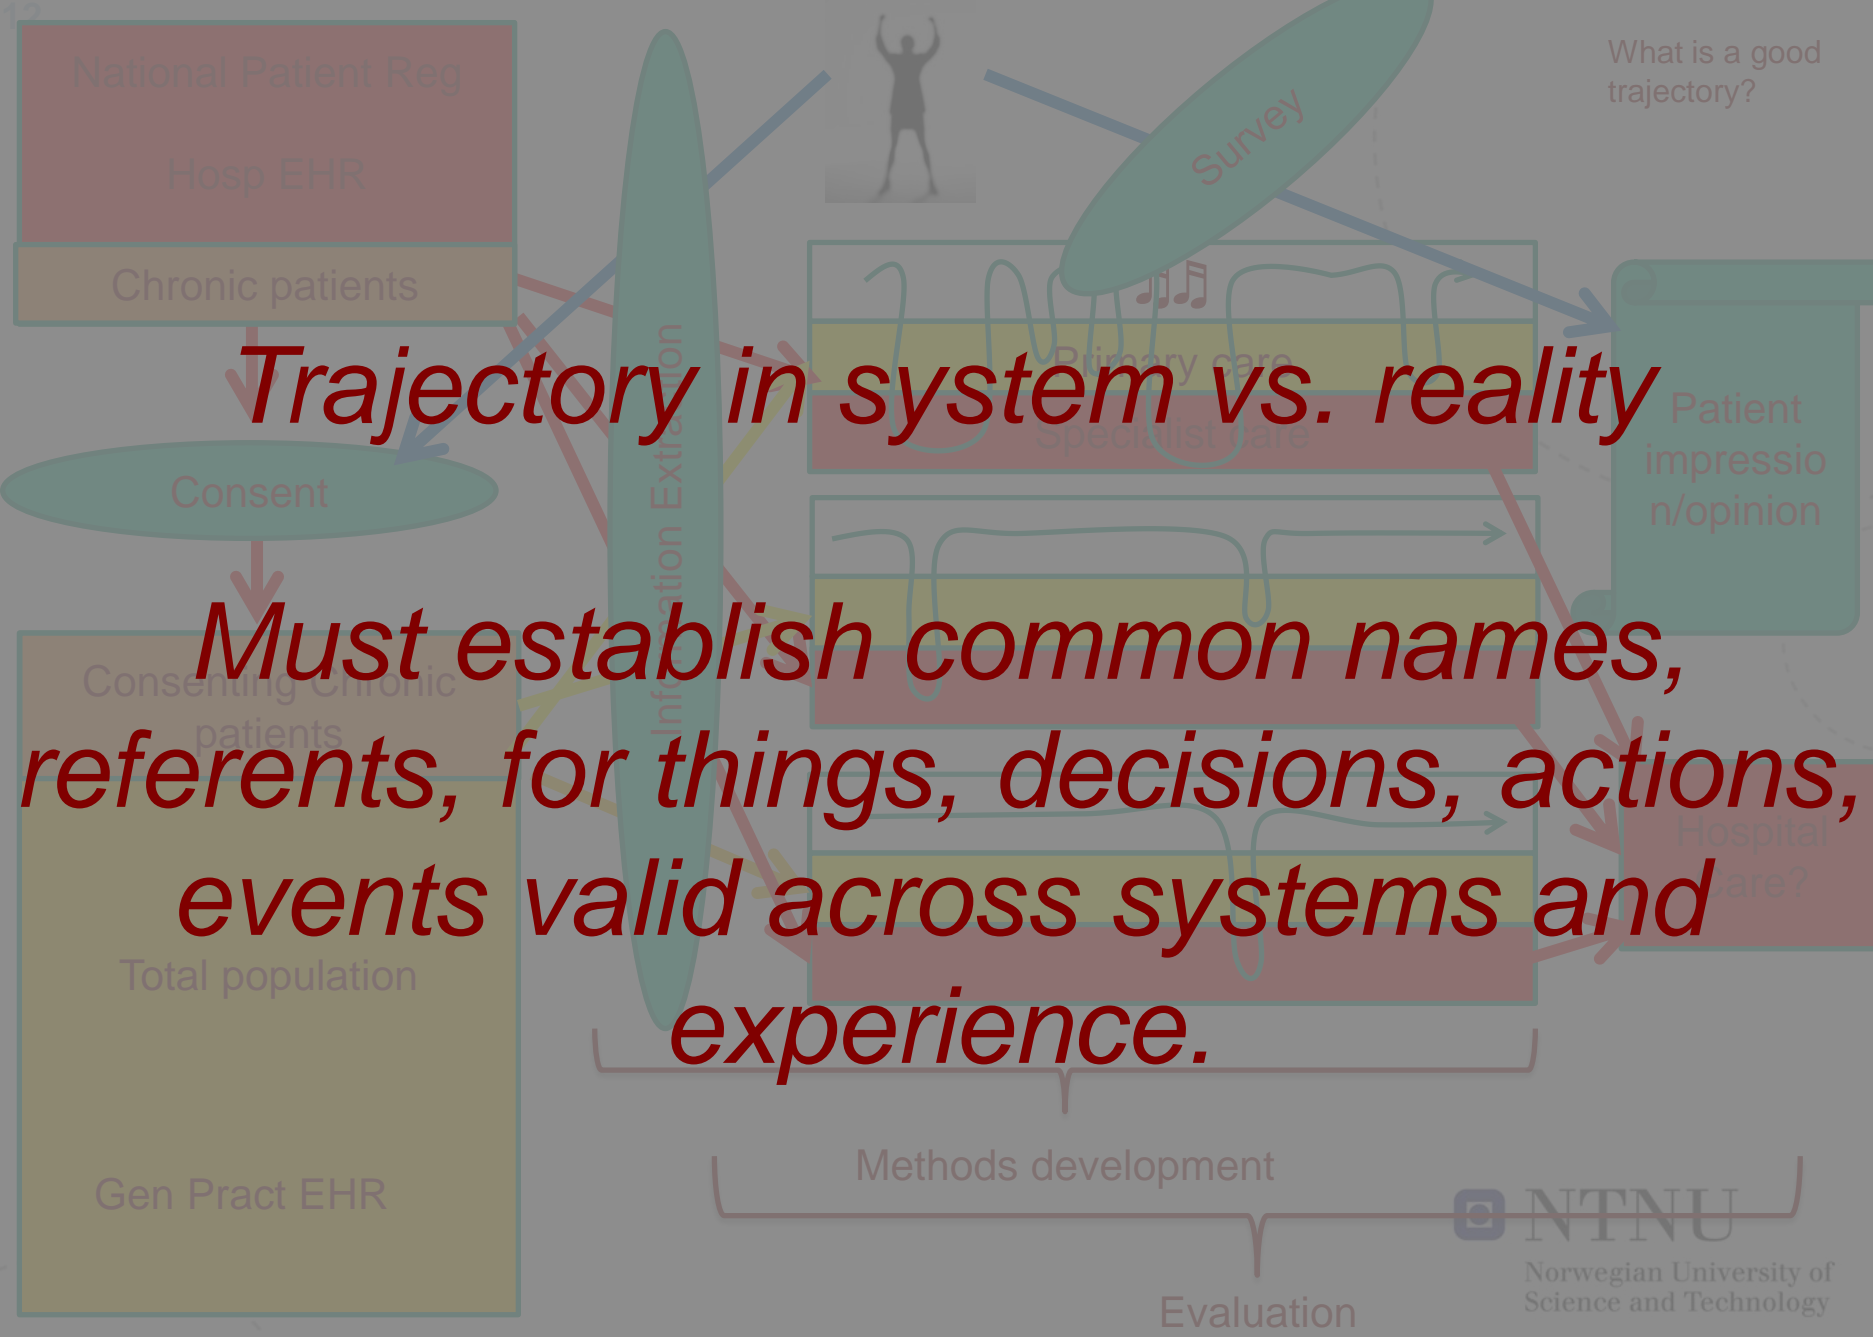

Primary care  
Specialist care

Patient  
impression  
n/opinion

Hospital  
Care?

Methods development

Evaluation

*Trajectory in system vs. reality*

*Must establish common names, referents, for things, decisions, actions, events valid across systems and experience.*

# Trajectory technology

## Capture & reasoning

- NLP
- Data quality and referent tracking.
- NER & events
- Anonymization
- Temporality, persistence and event reasoning

## Alignment:

- Clustering & search
- Process models

## Analysis:

- Query & visualization
- «Carelets»
- Care mapping for individual og group.

## Evaluation – Properties of the good trajectory:

- User-understandable process features
- Composability
- Borders
- Simple criteria

# Does trajectories exist?

- From a healthcare point of view?
  - No
- In one HIS?
  - Hardly, even with nice, global identifiers. Lots of noise and errors
- Across HIS?
  - Do not know
- Health data has ... low quality and validity, because noone uses them...

# Keeping patients out of hospital Patient Trajectories (Pastas)

Workshop, Stockholm 21 June 2012

**Rune Sætre**

# Outline

- My Background
- My Pet Program
  - FastlegeVakten
- Demo
  - Patient Explorer
  - Brat / Stay
- Summary

# CV

- →2003: MSc Computers: BusTUC @ [atb.no](http://atb.no)
- →2006: PhD Computer Science NTNU
  - Natural Language Understanding (NLU): [GeneTUC](#)
- →2010: Postdoc University of Tokyo, [TsujiLab](#)
  - Natural Language Processing (NLP): [MedIE](#)
- →2012: Postdoc NTNU: UbiCompForAll
  - [End User Service Composition](#)
- →2015: Postdoc NTNU
  - Keeping Patients Out of the Hospital
