

Suggested Solution to Exercise 2: Modelling a Conceptual Model of a Zoo

Erik Perjons

DSV, Stockholm University

Domain Description

- Zoo International is a company with eight zoos in several European cities. Each zoo has a name, an address and a telephone number.
- For each animal, the company need to document name, species, gender and birth year. The animal is taken care of by animal keepers. An animal keeper has a name, a mobile phone number and an employee number.
- An animal can either be born at the zoo or be bought from outside. As soon as an animal is born or arrive at the zoo, the animal need to be registered by an adminstrator at the zoo. The date for the registration need to be documented. The adminstrator has a name, a mobile phone number and an employee number.
- Each animal has a animal keeper that is responsible for the animal. A animal keeper can be responsible for several animals, but an animal can only have one responsible animal keeper.
- The administrators and animal keepers are employed by one zoo, they cannot be employed by several zoos

Your Task

- Represent the concepts/terms in the domain description by creating a conceptual model using UML Class Diagram

Domain Description

- Zoo International is a company with eight zoos in several European cities. Each zoo has a name, an address and a telephone number.
- For each animal, the company need to document name, species, gender and birth year. The animal is taken care of by animal keepers. An animal keeper has a name, a mobile phone number and an employee number.
- An animal can either be born at the zoo or be bought from outside. As soon as an animal is born or arrive at the zoo, the animal need to be registered by an administrator at the zoo. The date for the registration need to be documented. The administrator has a name, a mobile phone number and an employee number.
- Each animal has a animal keeper that is responsible for the animal. A animal keeper can be responsible for several animals, but an animal can only have one responsible animal keeper.
- The administrators and animal keepers are employed by one zoo, they cannot be employed by several zoos

Domain Description

- The administrators and animal keepers are employed by one zoo, they cannot be employed by several zoos

- Question: If you have access to a registration object can you find the the animal keeper that is responsible for the animal registered

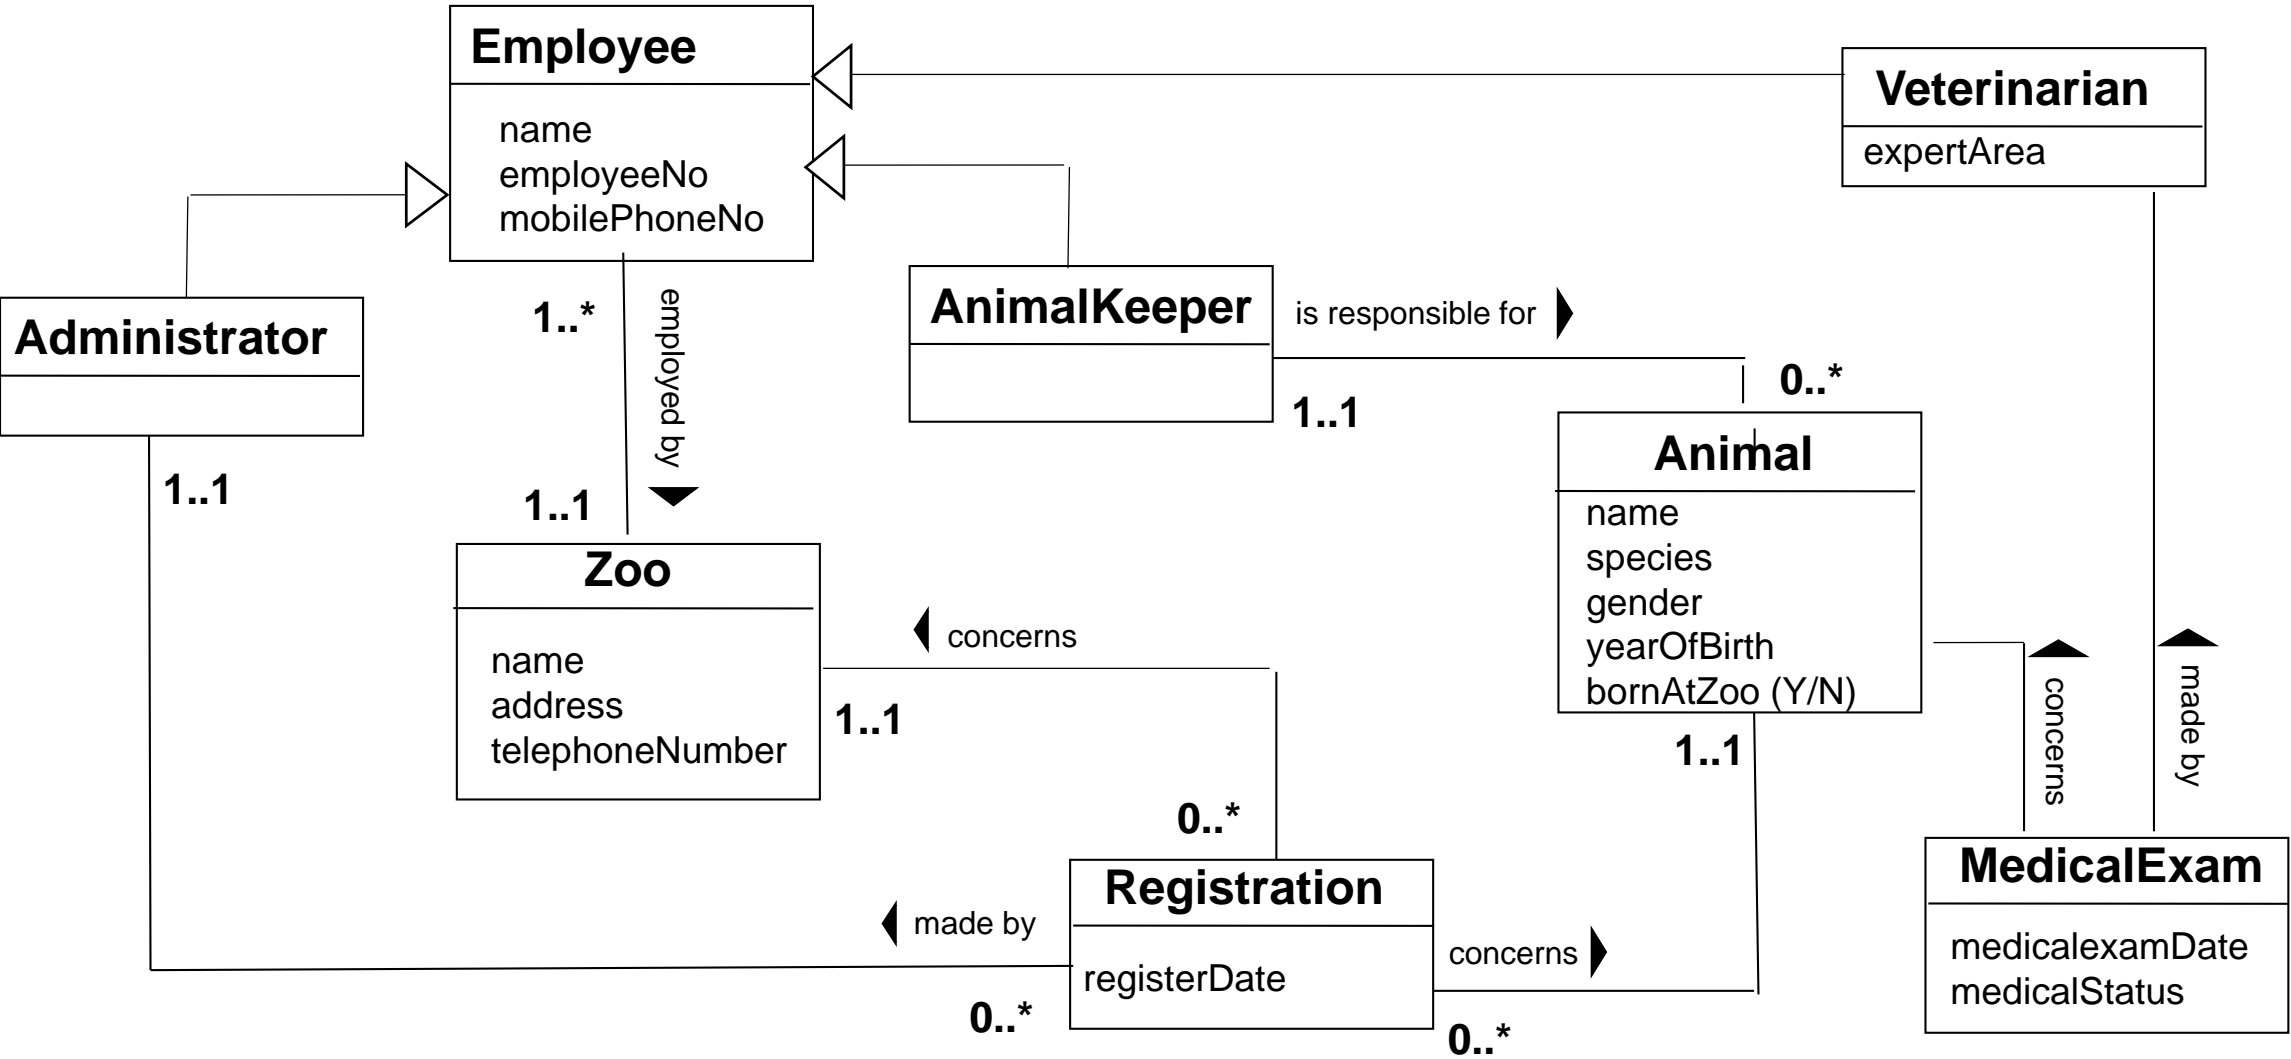

- Question: If I have access to a registration object can I find the the animal keeper that is responsible for the animal registered

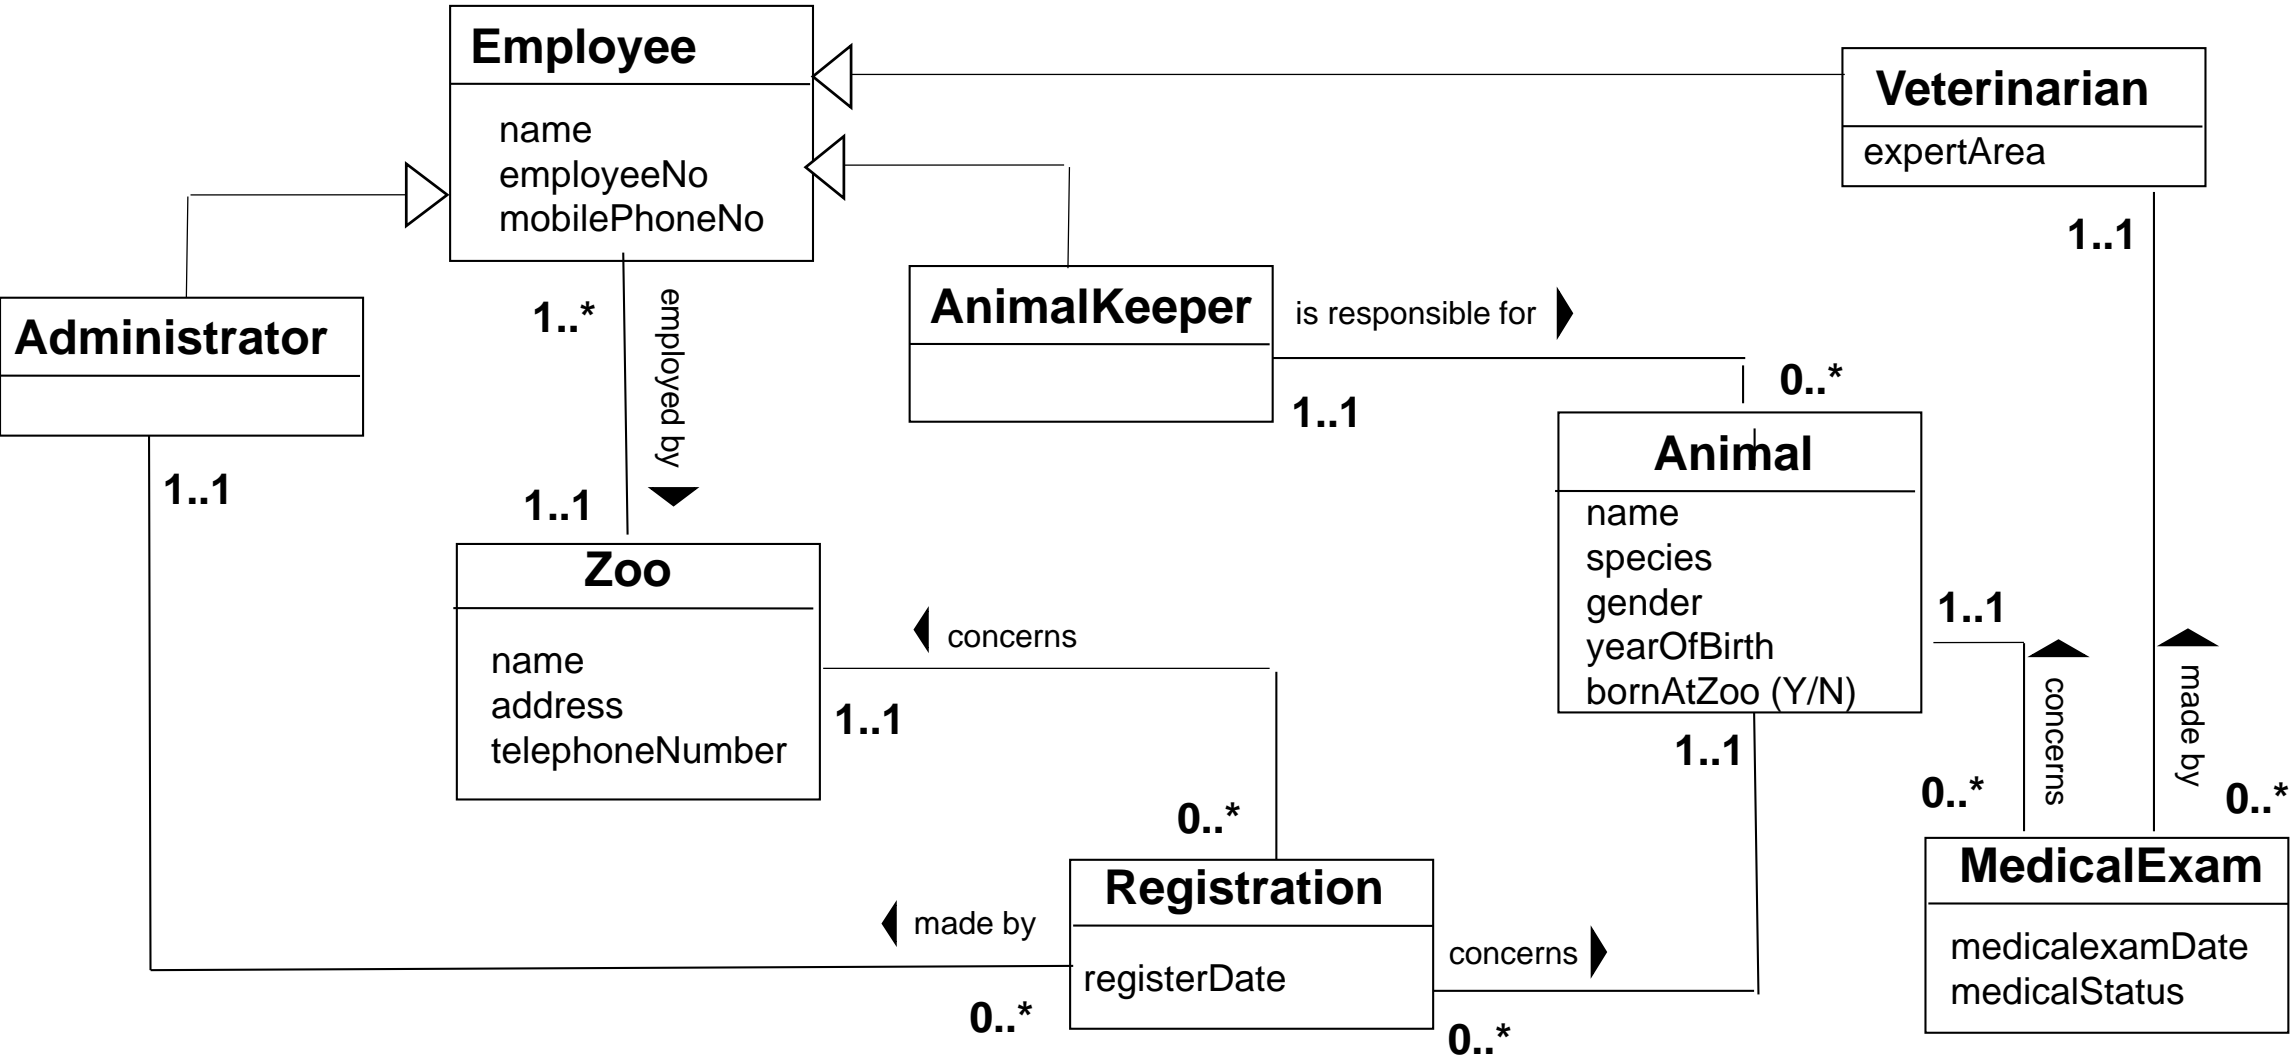

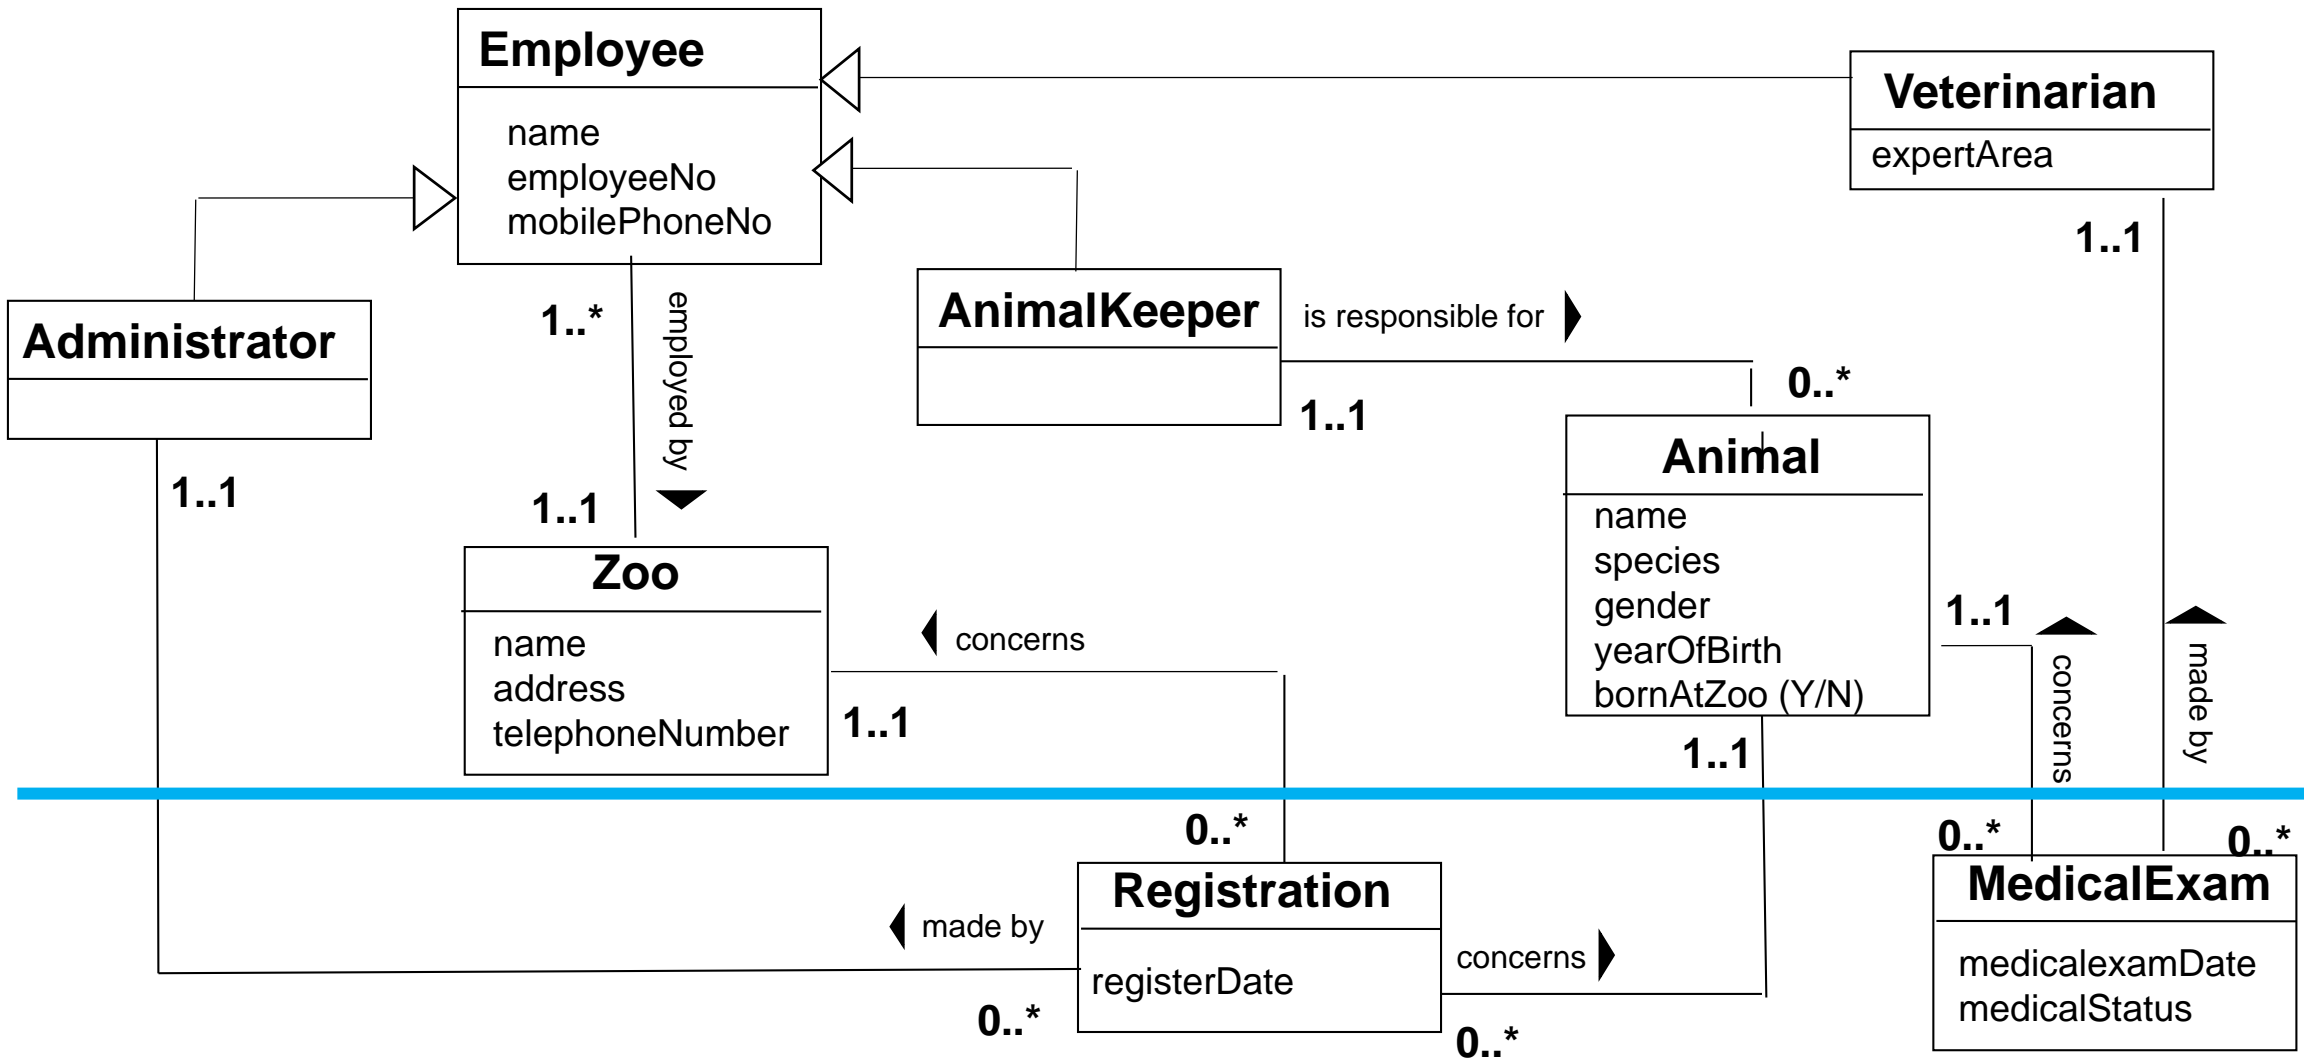

Domain Description

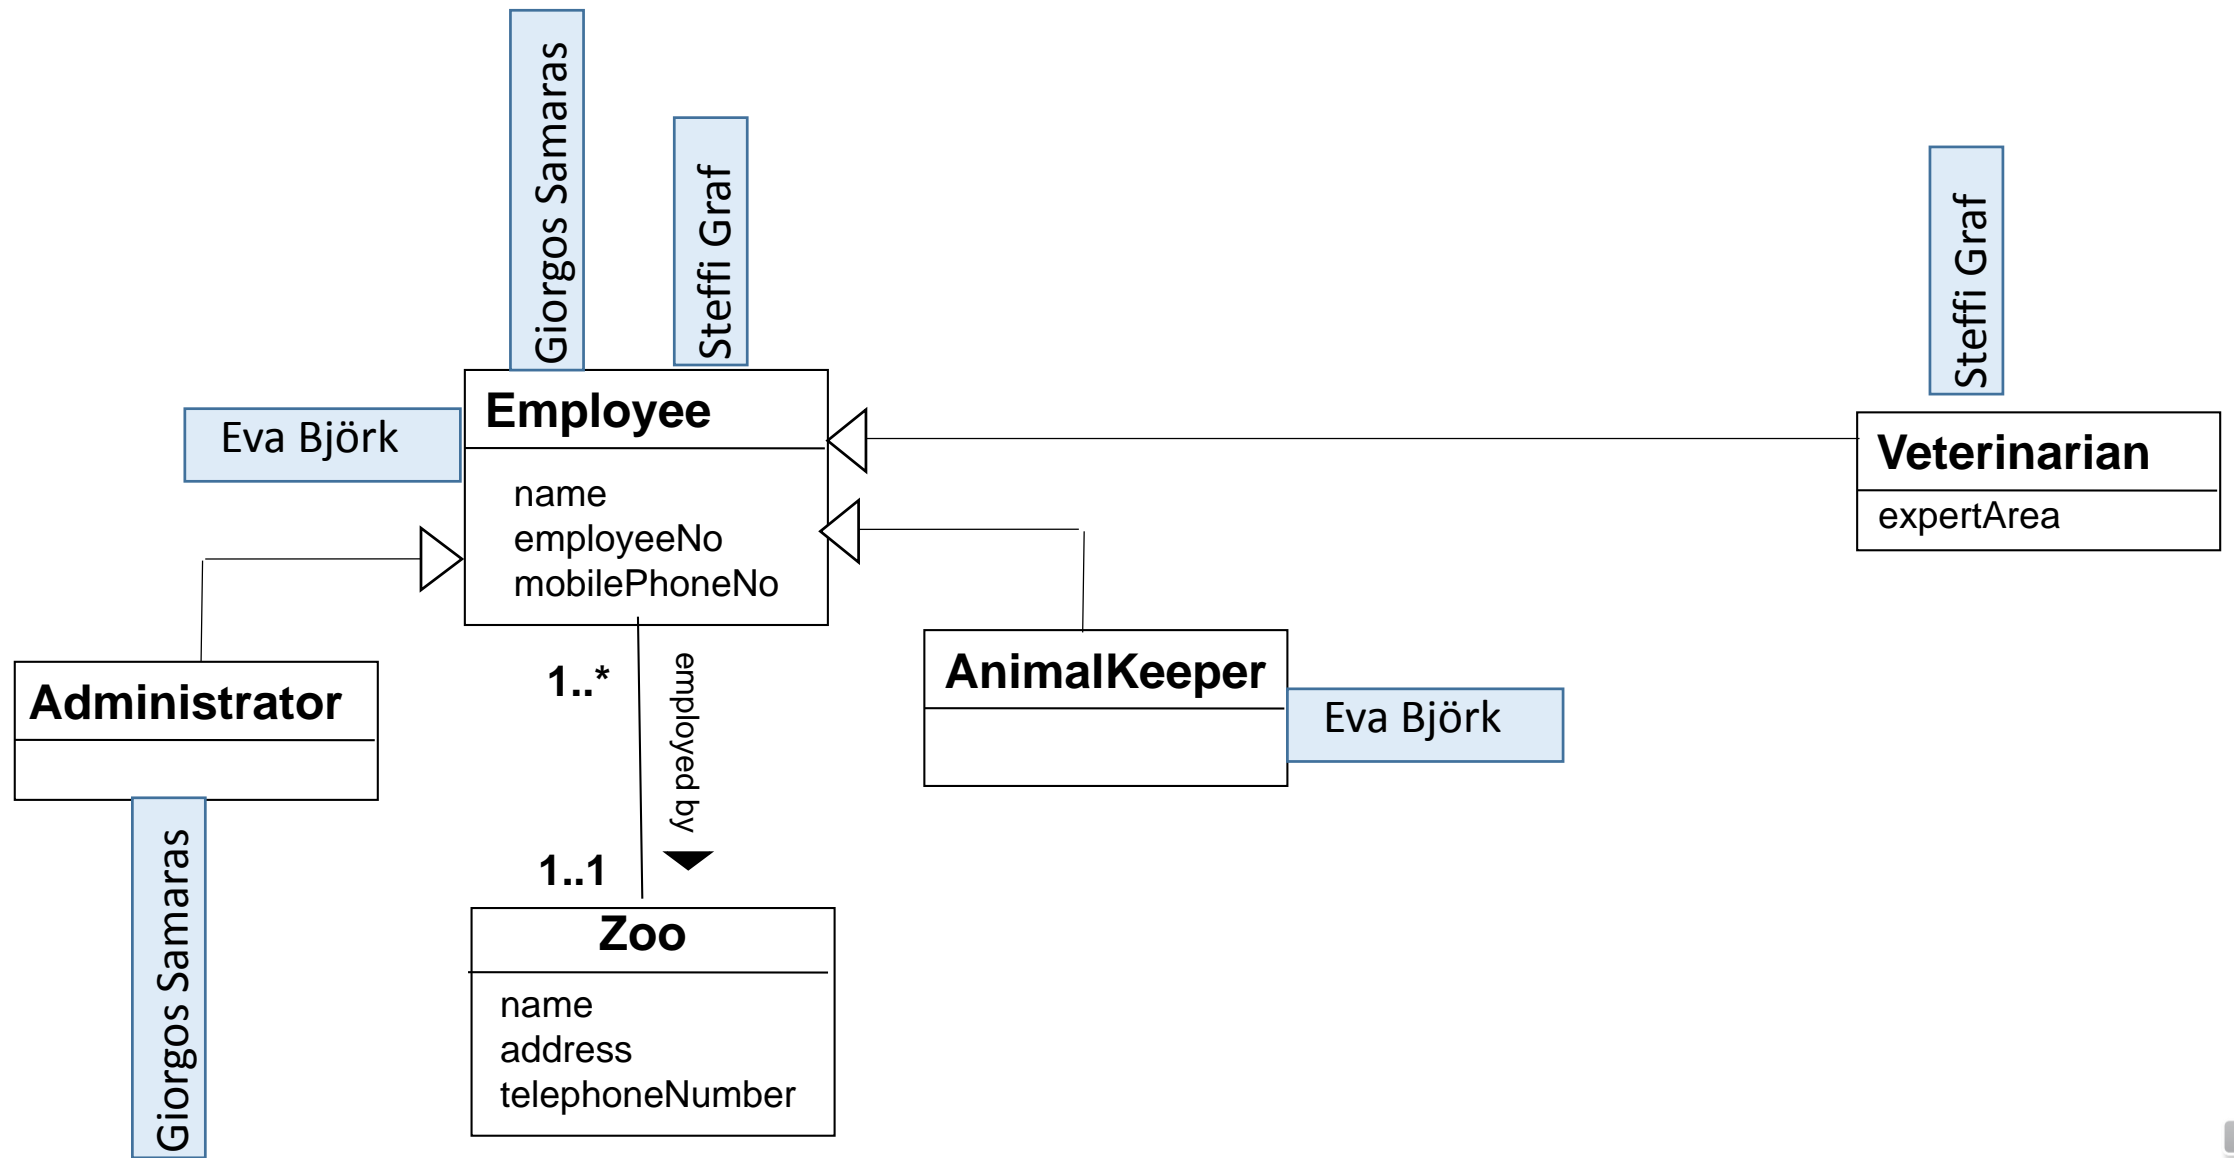

- Zoo International is a company with eight zoos in several European cities. Each zoo has a name, an address and a telephone number.
- For each animal, the company need to document name, species, gender and birth year. The animal is taken care of by animal keepers. An animal keeper has a name, a mobile phone number and an employee number.
- An animal can either be born at the zoo or be bought from outside. As soon as an animal is born or arrive at the zoo, the animal need to be registered by an adminstrator at the zoo. The date for the registration need to be documented. The adminstrator has a name, a mobile phone number and an employee number.
- Each animal has a animal keeper that is responsible for the animal. A animal keeper can be responsible for several animals, but an animal can only have one responsible animal keeper.
- During the introduction of an animal arriving at the zoo, a veterinarian needs to carry out a medical investigation, documenting the medical status, and the date for the investigation. The veterinarian has a name, a mobile phone number and an employee number as well as an expert area.

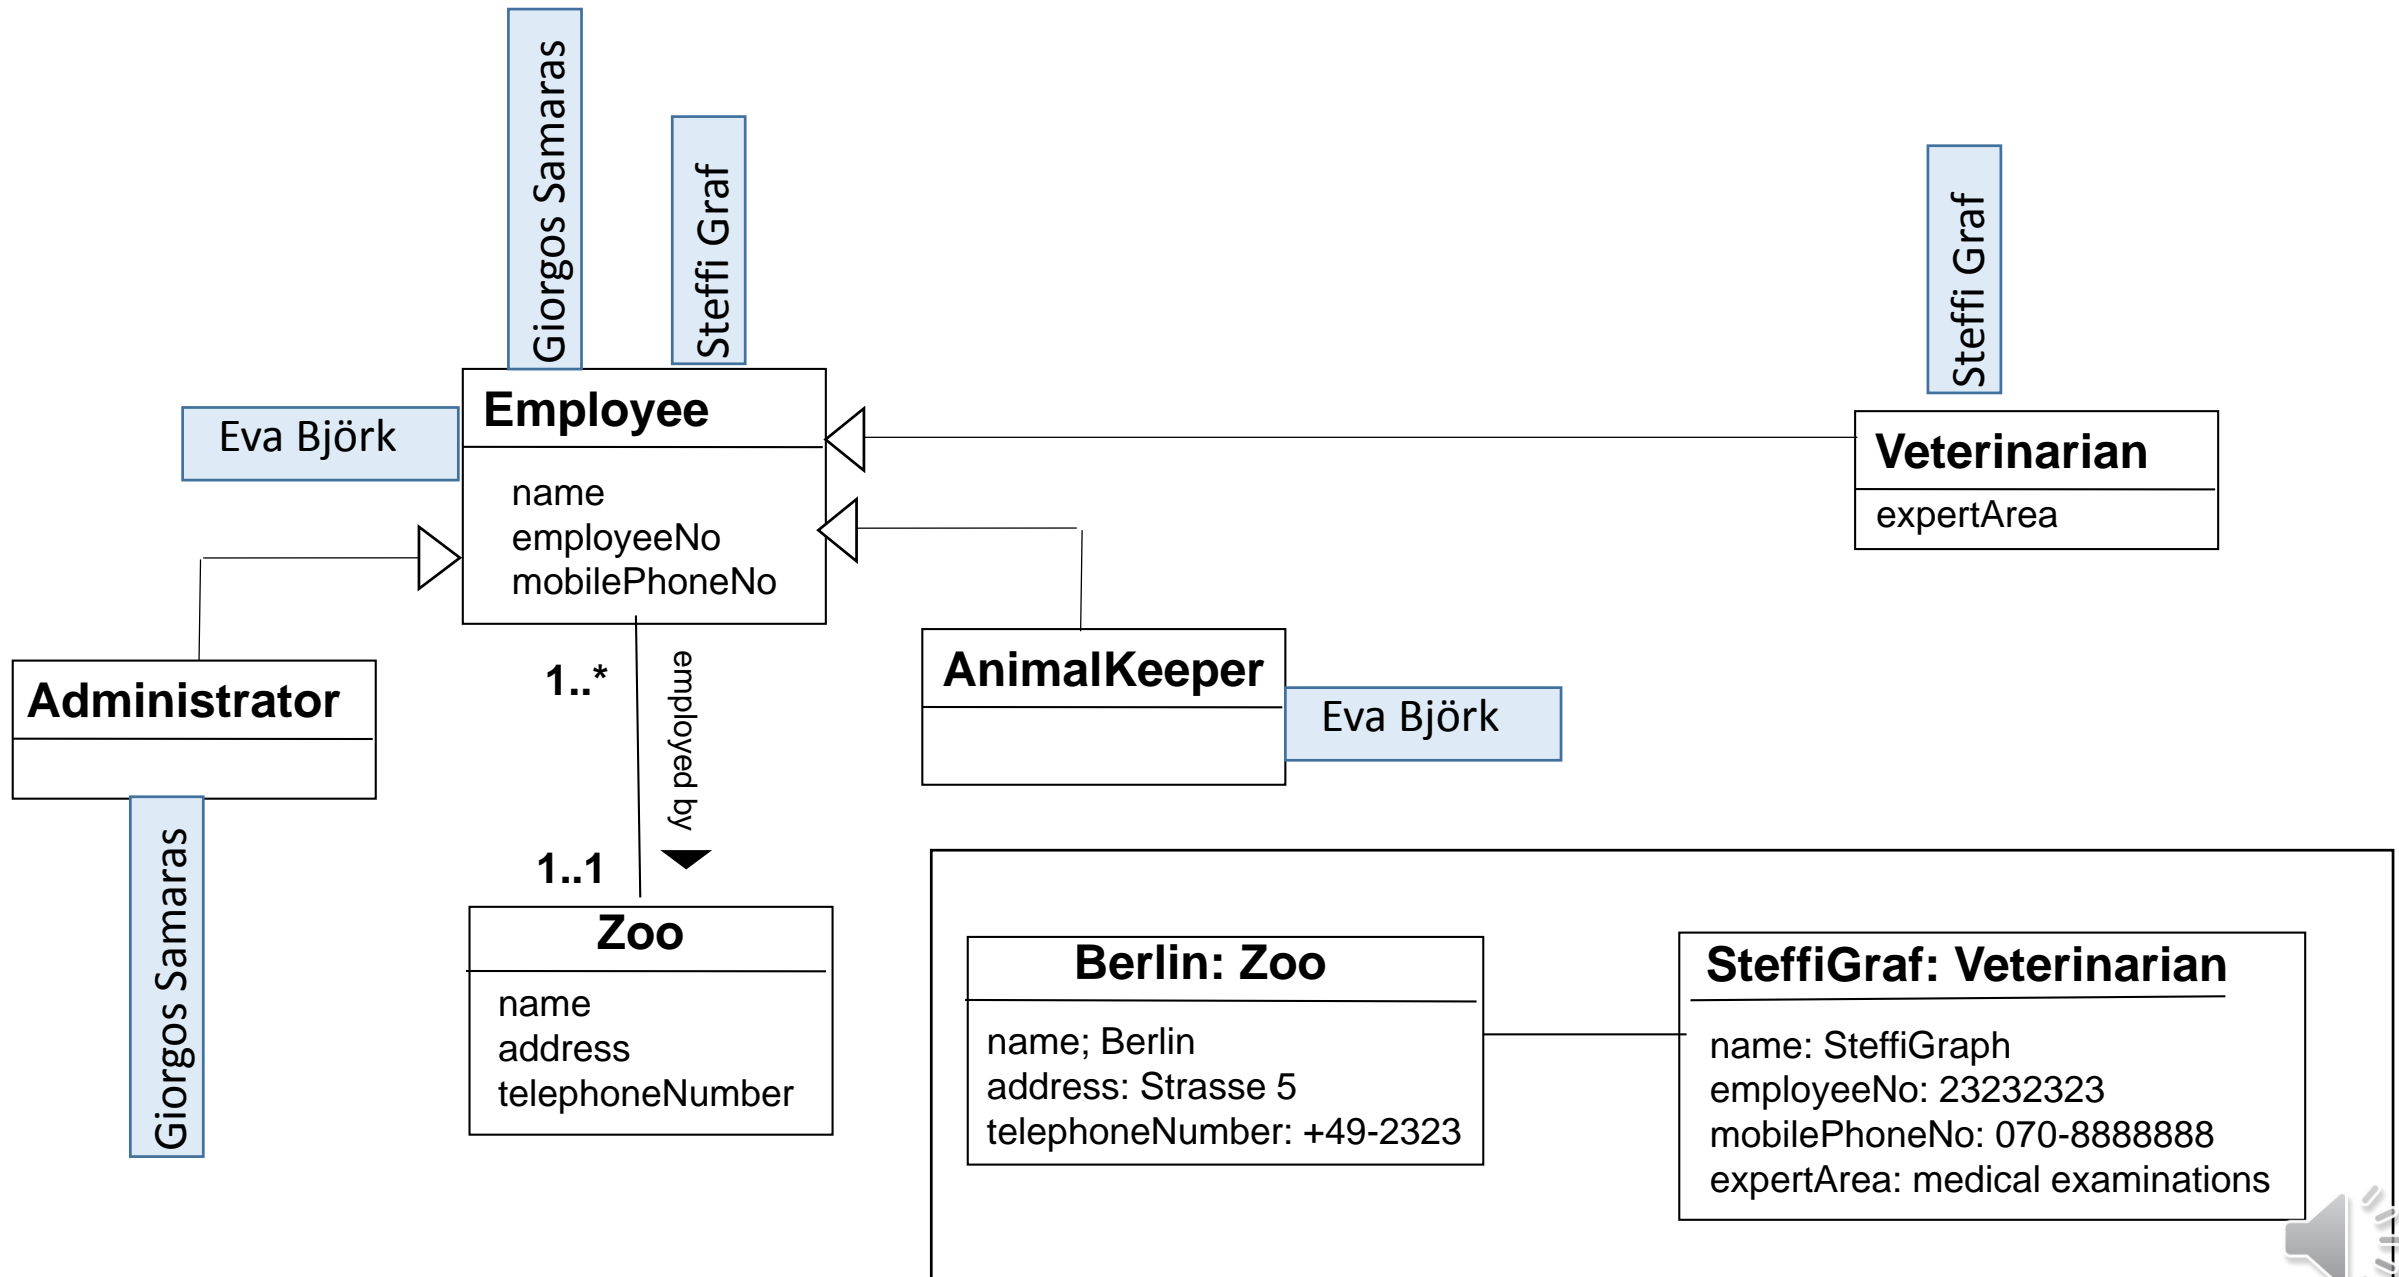

Guidelines

Guidelines

Nouns and verbs

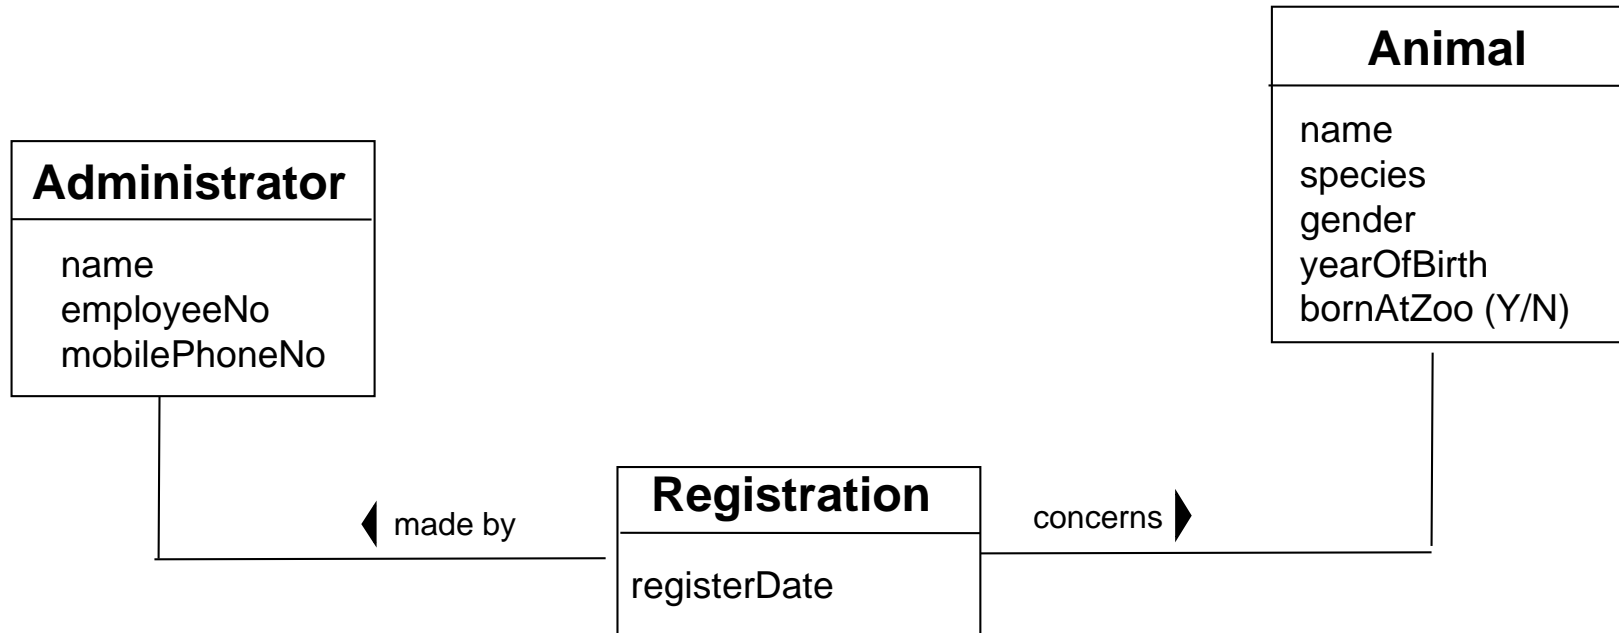

Guideline:

As a starting point: Nouns are modelled as classes (or attributes) and verbs as associations

Some associations shall be classes

Guideline:

Associations that need to have a date (or some other attribute), shall be transformed to classes

Identify action/event classes – and note the multiplicity

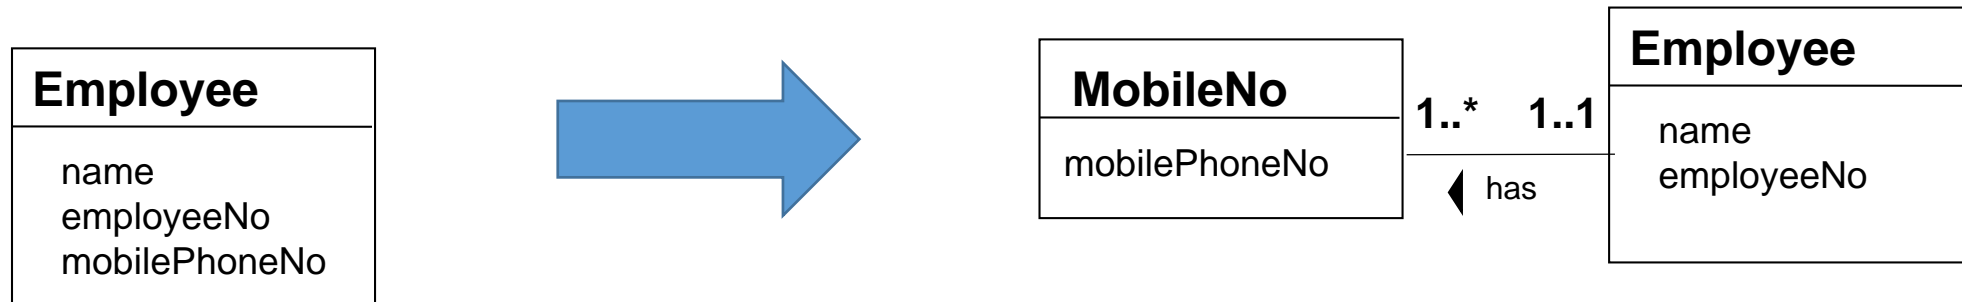

Guideline:

It simplifý modelling to early find the action/event classes - and note the common multiplicity from and towards these type of classes

Some attribute shall be classes

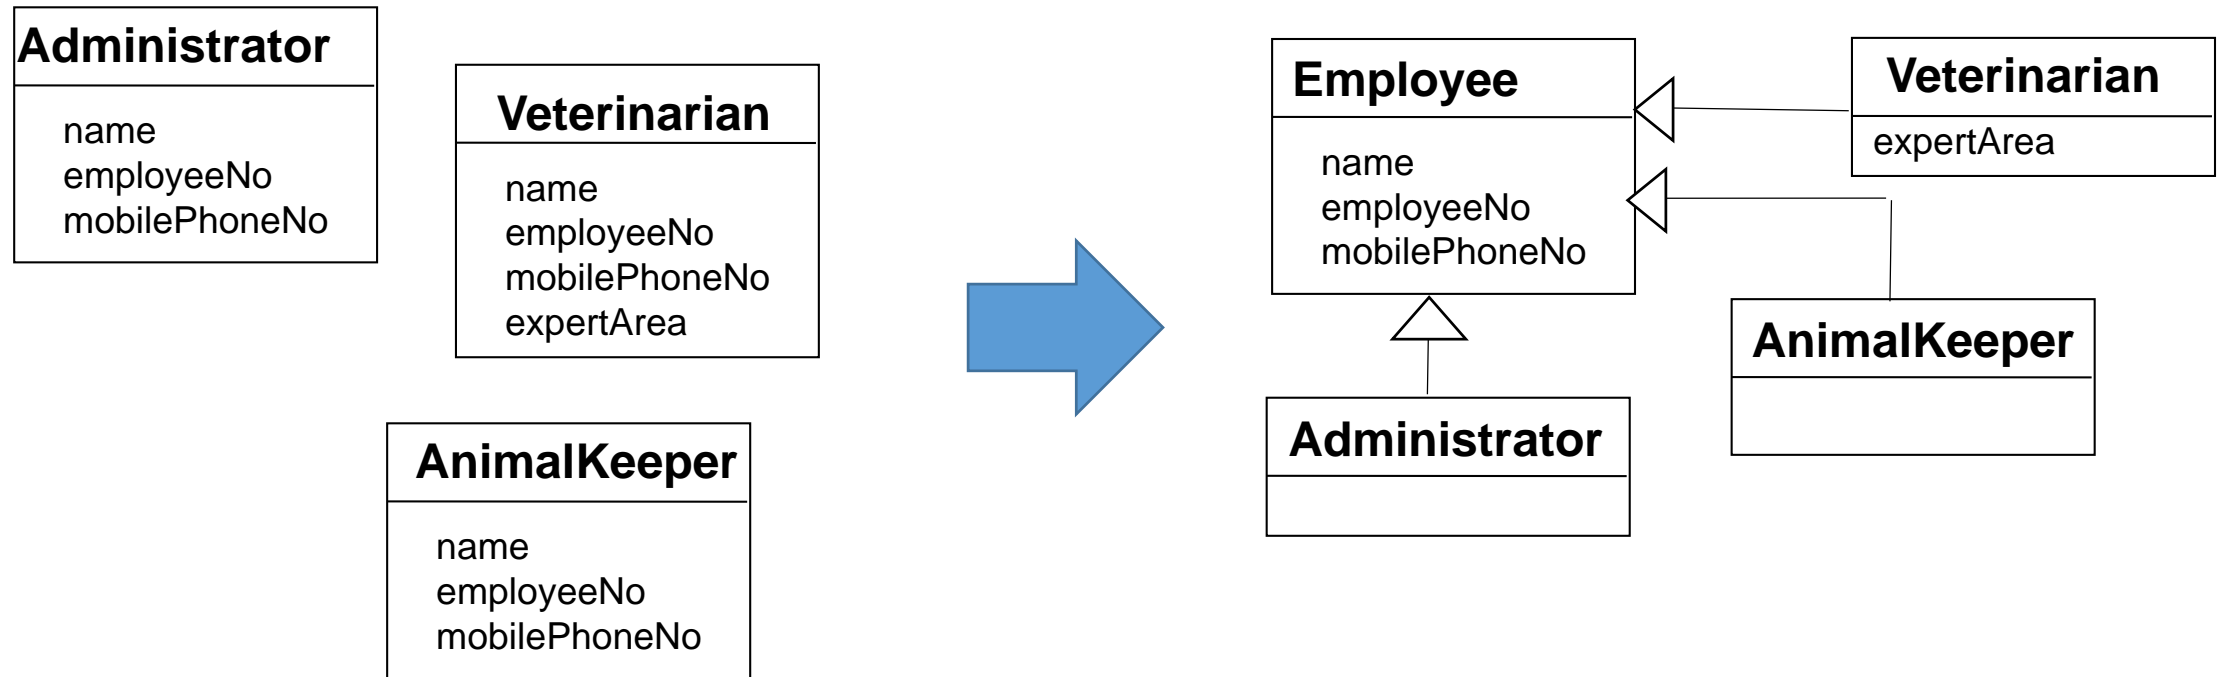

Guideline:

Attribute that can have several values should be transformed to classes, That is attribute should have the multiplicity `1..1`, if not, create a new class for the attribute

Make use of generalizations

Guideline:

Make use of generalizations if possible. It makes the conceptual model easier to interpret

DO NOT MODEL OBJECTS
